Communication for Brainwave GRC's clients.
Brainwave GRC's positioning regarding the Log4j library vulnerability.

Madam, Sir

I wished to inform you about Brainwave's handling of and official position with regards to the CVE-2021-44832 vulnerability discovered in the Log4J library.

As of today, no Brainwave product has or will be affected by the CVE-2021-44832 issue.

When previously considering the possibility of migrating the Log4J library, Brainwave GRC carefully analyzed the evolutions and impacts between version 1 and version 2. Following this analysis, we chose to continue using version 1, as have other software companies. Version 2, the only version impacted by the CVE-2021-44832 vulnerability, corresponds to a breaking technological change when compared to version 1. As a result, the cost/benefit gap of this migration was deemed unfavorable with regards to the usage of the library within Brainwave GRC.

Following this decision, we decided to fork, support, and maintain the current library. As such, Brainwave GRC has committed to correcting vulnerabilities and providing improvements within the maintenance and updating of the software package.

Rest assured that Brainwave's top priority remains the security and sustainability of our technical choices and developmental activities. We are committed to providing a level of service that exceeds the expectations of all our customers.

I remain available for all further questions and enquiries.

Kind regards,

Cyril GOLLAIN
President of BRAINWAVE SAS
